WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

WEEK ENDING 4 FEBRUARY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined both decreased approximately 8 percent during the week ending 4 February 1944 as a result of a 17 percent decline in the admission rate from colds, influenza, etc. While morbidity had shown a slight downward trend during the preceding two weeks, the first substantial decrease in admission rates this year was registered for the week ending 4 February 1944. The admission rate from all causes for this week was reported at 771 per thousand per year and the corresponding all diseases rate at 703 per thousand; these rates were both about 22 percent below the corresponding rates for the week ending 4 February 1943, at which time morbidity from colds and influenza was on a relatively high level. The admission rate from injury for the week ending 4 February 1944 was 68 per thousand or on about the same low level as during the preceding four weeks.

The admission rate from colds, influenza, etc. for the week ending 4 February 1944 was reported at 274 per thousand per year. This is the lowest morbidity from these causes experienced since the last week of November 1943 and almost 40 percent under that recorded for the corresponding week of 1943. The admission rate from all forms of pneumonia remained substantially unchanged, on about the same level as that which prevailed early in February 1943.

Morbidity from venereal diseases (excluding infections contracted prior to induction), which had increased considerably in January, registered during the week ending 4 February a marked decrease to about the level prevailing in December 1943.

The number of new cases of measles and mumps increased sharply during the week to the highest figures reported since 28 May 1943 and 25 June 1943 respectively. The number of new cases of scarlet fever was lower than for the preceding week. New cases of meningitis and rheumatic fever remained about the same as reported for the preceding week.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

The Third Service Command reported a reduction in the admission rate for all diseases combined from over 1000 per thousand per year to 810 per thousand, attributable largely to markedly lower morbidity from respiratory causes. Sizeable decreases in morbidity from disease were also reported from the Seventh, Fourth, and Sixth Service Commands, reflecting chiefly substantial decreases in admission rates from respiratory causes. Only the Military District of Washington experienced slightly higher morbidity from disease, due to a corresponding small increase in the admission rate from colds, influenza, etc.

The highest morbidity from all causes - in excess of 1000 per thousand - continued to be reported from the Seventh Service Command which also continued to experience the highest morbidity from colds, influenza, etc. (nearly 450 per thousand) and the highest morbidity from all forms of pneumonia (over

WEEKLY HEALTH REPORT

WEEK ENDING 4 FEBRUARY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

80 per thousand), reflecting an extremely high rate of admission at Jefferson Barracks, Mo., whose rate had been rising steadily for some time and reached 820 per thousand during the week ending 4 February 1944. The lowest morbidity from all causes - 650 per thousand - continued to be reported from the First Service Command. However the lowest admission rate from colds, influenza, etc. (of just over 200 per thousand) was registered in the Eighth Service Command.

Morbidity from venereal diseases (excluding EPTI cases) decreased in every Service Command except the Seventh. Despite a particularly sharp decline in the admission rate reported, the Second Service Command continues to show the highest morbidity from these causes, being closely followed by the Fifth Service Command.

The largest numbers of new cases of measles continued in the Fourth and Eighth Service Commands, which together accounted for nearly two-thirds of the total number of new cases. The largest number of new cases of mumps was again reported from the Fourth Service Command, but the Ninth Service Command showed the largest increase in new cases over the preceding week to reach a total close to that for the Fourth Service Command. About 40 percent of the new cases of meningitis occurred in the Fourth Service Command, while the Seventh Service Command continued to account for the largest number of new cases of rheumatic fever.

STATIONS WITH THE HIGHEST MORBIDITY RATES

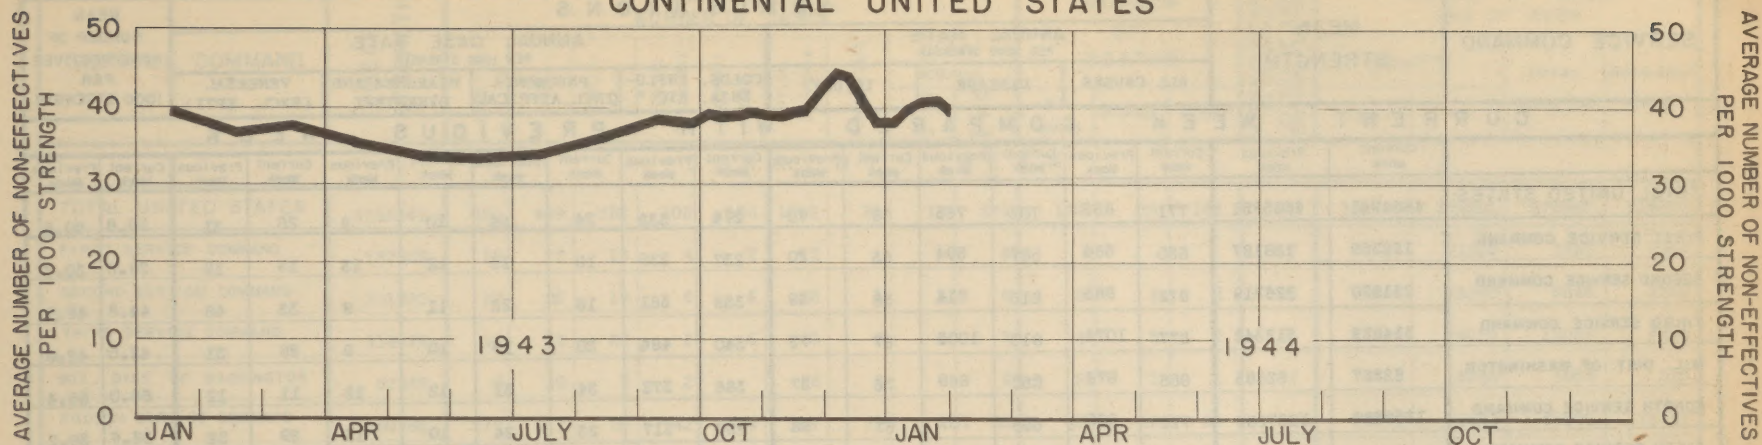

Of the six stations reporting the highest morbidity from all causes, three were stations with very high admission rates from colds, influenza, etc. (Miss. Ord. Plant, Miss., Greensboro AAF, N.C. and Nashville AAC, Tenn.), one was Jefferson Barracks, Mo. with an exceptionally high rate of admission from pneumonia, and two were reception centers (Ft. Sheridan, Ill. and Ft. Benjamin Harrison, Ind.) with high morbidity due to venereal infections contracted prior to induction.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity reported, as of 4 February 1944 was close to 365,000 or substantially the same as at the end of the preceding week. The number of beds occupied as of 4 February 1944 was about 174,000 or 5,000 less than at the end of the previous week; the number of "available vacant" beds increased to nearly 120,000. On 4 February there were 33 stations with a bed capacity of about 20,000 which had no "available vacant" beds; included among them were only two general hospitals with a bed capacity of 2,000 beds.

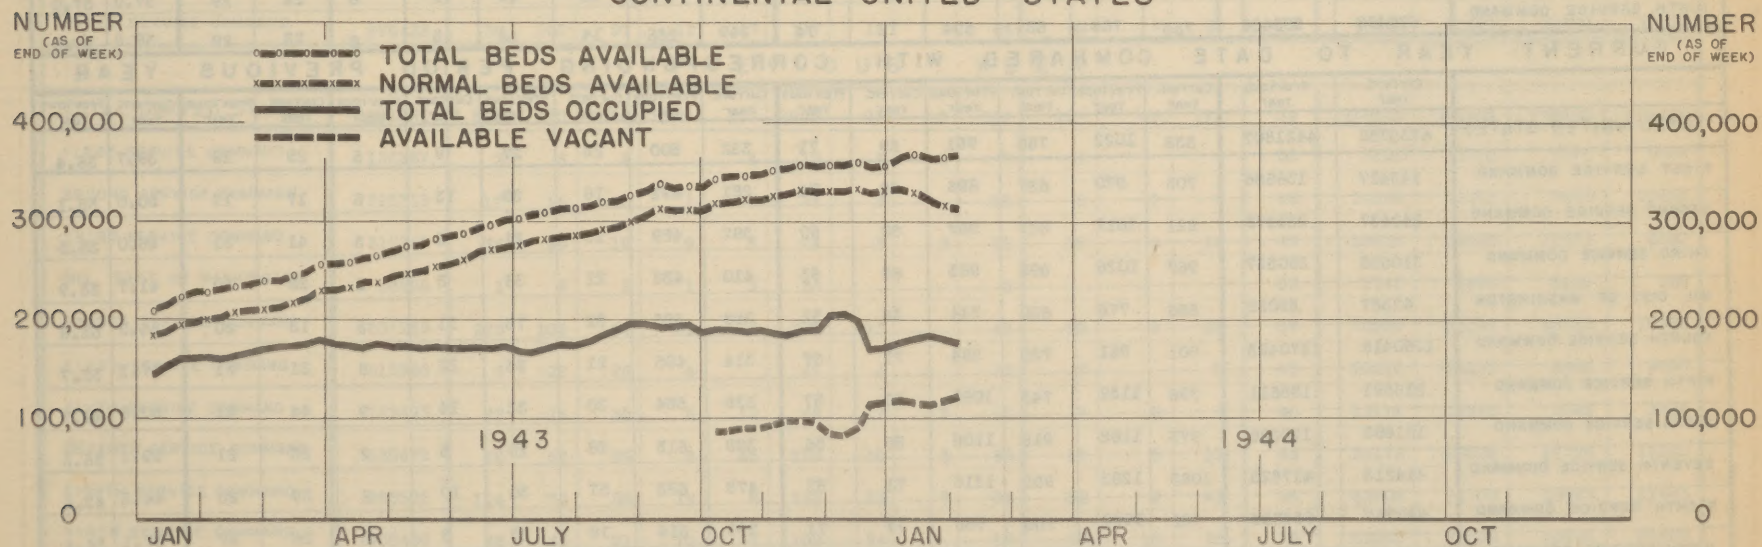

On 4 February 1944 there were 2,132 cases of malaria remaining under treatment, all but 44 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining at end of the week was reported at 16,144 while the number of tuberculosis cases remaining totaled 1046.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 JANUARY 1944

PRISONERS OF WAR

During the four week period ending 28 January 1944, morbidity from all causes among prisoners of war was at the very low level of about 610 admissions per year per thousand strength or only about 70 per cent of that for U.S. troops in the continental United States during the same period. Morbidity from all diseases combined during January was 530 per year per thousand strength or only about 65 percent of that for U.S. troops in this country. As compared with December the admission rates for all causes and all diseases combined was about 15 percent lower, reflecting chiefly decreased morbidity from colds, influenza, etc. The January admission rate for injury was at about the same level as for the previous month and somewhat higher than that for U.S. troops in the continental United States. The morbidity among German prisoners was higher than for Italian prisoners for both disease and injury admissions. The injury admission rate for Italian prisoners continued as in previous months at the very low level of about 40 per thousand which is only about half that for U.S. troops in this country.

Morbidity from colds, influenza, etc. among prisoners of war decreased from the rate of 238 per thousand experienced in December to 182 per thousand in January. As in earlier months morbidity from these causes among prisoners of war was considerably below the corresponding rate of about 350 per thousand for U.S. troops in the continental of United States. The markedly lower rates of admission from respiratory causes among prisoners of war account in large part for the much lower morbidity from disease of prisoners of war as compared with U.S. troops in the continental United States. An important reason for the lower morbidity from respiratory causes among prisoners is that their camps are predominately located in the Southern states which did not experience as high morbidity from colds and influenza as the remainder of the country.

In January there were only two cases of diphtheria reported among prisoners of war, whereas in previous months there had been relatively many cases. Likewise the number of new cases of jaundice was quite small in comparison with earlier months. The annual admission rate from malaria among prisoners of war (representing almost entirely cases acquired outside of the United States) increased to 30 per thousand strength in January or about the same level as had prevailed prior to the low rate of 17 per thousand reported for December 1943. Morbidity from malaria continued at a higher rate for Italian prisoners than for the Germans, the admission rates being 37 and 27 per thousand respectively. For the first time there were reported some cases of malaria acquired in the United States, namely three at Camp Perry, Ohio (Italian); verification of these cases has been requested. The admission rate for diarrhea

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 JANUARY 1944

PRISONERS OF WAR (CONT)

and dysentery decreased seasonally to 4 per thousand strength. All the other causes of admission considered in the following tables showed relatively small numbers of cases.

The camps representing the highest morbidity from all causes and from disease were McLean, Texas (German), Ruston, La. (German) and Ft. Robinson, Nebr. (German). Certain camps continue to have high admission rates from injury, namely: Clinton, Miss. (German), Camp Shelby, Miss. (German), Camp Gruber, Okla. (German), Madill, Okla. (German), McLean, Texas (German), Ruston, La. (German), and Pine Camp, N.Y. (Italian) all of which had rates of about 300 per thousand or higher.

The number of prisoners of war patients under treatment in hospital and quarters and the rate per thousand strength are shown in the table below. In contrast with the corresponding rate for U.S. troops in the continental United States (about 40 per thousand) prisoners of war show a relatively low proportion remaining under treatment.

	Number <u>Remaining</u>	Remaining per <u>1000 strength</u>
German	2075	17
Italian	918	19
Japanese	2	2
Total	2995	18
